

AVGAS 91UL

The safest fuel
of the future – for the future

AVGAS 91UL is designed with the General Aviation safety factor in mind. Essentially it is a fuel very similar to AVGAS 100LL, without the addition of tetraethyl lead, which is very well known for being a cause of multiple health and environmental hazards. The fuel and its composition results in a reduced antiknock rating which is similar to the one found with MOGAS, only without the many risks associated with the use of motor gasoline in aviation engines.

Do not risk it with MOGAS.

Visit us at Aero Friedrichshafen to learn more about UI91.
